

AI Engineering Field Guide

A practical guide to building AI-enabled products with evaluation and reliability.

How to use this guide

Use these topics as a study and evidence checklist. Competra does not treat reading a guide as proof of competency; pair learning with practice, a project task and an unfamiliar-context assessment.

1. AI application architecture

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

2. Prompt and provider boundaries

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

3. Evaluation datasets and criteria

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

4. API integration and failure handling

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

5. Privacy and data boundaries

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

6. Testing and observability

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

7. Production cost and reliability

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.
