

Data Science Field Guide

A competency-oriented guide to analytical and modeling workflows.

How to use this guide

Use these topics as a study and evidence checklist. Competra does not treat reading a guide as proof of competency; pair learning with practice, a project task and an unfamiliar-context assessment.

1. Problem framing

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

2. Data quality

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

3. SQL and exploration

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

4. Feature design

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

5. Model evaluation

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

6. Experimentation

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

7. Communication and reproducibility

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.
