

Cybersecurity Field Guide

A learning guide for secure engineering and security analysis.

How to use this guide

Use these topics as a study and evidence checklist. Competra does not treat reading a guide as proof of competency; pair learning with practice, a project task and an unfamiliar-context assessment.

1. Threat modeling

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

2. Identity and access

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

3. Input validation

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

4. Secure dependencies

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

5. Logging and monitoring

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

6. Incident thinking

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.

7. Security testing

Evidence target: explain the concept, apply it in a small task, test the behavior, and be able to defend one design decision. Suggested proof should be observable in a project, challenge or assessment rather than inferred from completion alone.
